

THE DASH SINGLE PANE OF GLASS

**Every reporting cycle,
a VP loses time to
fragmented, manual data.**

How the VP experience works today, and the single pane of glass it becomes.

MEET THE VP

One leader, one portfolio, one relentless cycle

A Digital VP owns investment, delivery, cost, capacity and value — and is accountable for all of it in the leadership performance rhythm (GFO · IGM · EPR · WPR). Here is the cycle they live through, again and again.

The emotional low is stage 2. The highest value is the moment stage 3 insight finally becomes a stage 4 decision.

Fragmented, manual, painful

This isn't a hypothesis. It's what the VPs themselves say when asked how performance reporting works today.

"We need a consistent driver of amber / red causes and themes. EPR is the opportunity to look for broader insight."

"Where do we include measures on how digital is performing — CICD, ADO use, UDP coverage, velocity, ageing of tickets in SNOW?"

"A view of upcoming or overdue audit actions should be included."

What it costs the VP

- Low trust — conflicting numbers send them back to people, not dashboards.
- Wasted effort — performance re-assembled by hand every cycle.
- Lost time — acting on insight means leaving for separate tools.
- Insight gap — outputs are data-heavy but insight-light.

THE DEEPER PROBLEM

“Data is a problem” isn’t one problem

The most common reason reporting stalls — and the vaguest. Name which one you actually mean, who owns it, and what it blocks.

“It’s all over the place”

30+ ERP instances, siloed tools.

→ **Consolidate & integrate the sources**

“The numbers don’t agree”

No single source of truth; endless reconciliation.

→ **Data-as-a-product, common semantics**

“It’s all in spreadsheets”

Logic trapped in Excel and manual workarounds.

→ **Move logic out of Excel into governed tools**

“No one owns it”

Unclear ownership; no accountable steward.

→ **Name data & KPI owners**

“We can’t trust it”

Quality and validation gaps, not signed off.

→ **Validation & reconciliation rates**

“We can’t get at it”

Data exists but isn’t connected or reachable.

→ **Integration standards & catalogue**

“It’s all in people’s heads”

Process owned by individuals, not systems.

→ **Capture & automate the manual steps**

Each one has a different owner and a different fix — “data is a problem” is an excuse until you name WHICH one.

The Single Pane of Glass

Everything a VP needs to manage a portfolio in one view — built in stages, not big-bang. The focus group shapes what comes first.

● Delivery

NOW

Project progress, investment delivery, ADO velocity, exec reporting.

+ **CICD pipelines** · **UDP coverage** · **ticket ageing**

● Money

NOW

Investment, opex, LE, trend analysis, licences — cost tied to value.

+ **consistent amber / red themes for EPR**

● Operations

NEXT

SNOW data, MTTR and service health — the signal between forums.

+ **upcoming & overdue audit actions**

● People

LATER

Workday, recruitment, TRM third parties — capacity beside commitments.

+ **resourcing & talent visibility**

NOW = delivery & money domains, building on the metrics layer in progress. NEXT / LATER = sequenced as the data foundation matures.

HOW THE SINGLE PANE IS ORGANISED

Three components, one structure

The way Transformation is structuring “how we work” — and how the portfolio domains map into it.

1 People

Who delivers the portfolio — own staff and the contracts around them.

2 Strategy

Where the portfolio is going — the synthesis & signal layer (the currently-absent piece).

← the absent piece, now being built

3 Execution

How it gets delivered — team delivery, ADO linkages, product-review richness.

THE PORTFOLIO DOMAINS MAP IN LIKE THIS

Delivery, Operations, Money

→ **Execution**

How the team delivers — progress, service health, cost-to-value.

People

→ **People**

Resourcing & capacity — expanded below.

Themes & signal

→ **Strategy**

The “why” behind amber/red — the synthesis layer.

Inside People, three resource types: own staff · contracted third parties (direct) · managed-service / outcome-based — *for outcome contracts we manage the outcome, not the heads.*

THE PROOF

This isn't aspiration — it's already working

The foundation is built and validated with delivery teams. The design lift is proven, not hypothetical.

20 / 21

stakeholder requirements

delivered in the KPI widget v2, built collaboratively with delivery teams.

9 / 9

exec metrics readable

at a glance with no manual calculation — versus 2 of 9 in Palantir's native interface.

4 domains

designed from VP input

Delivery, Operations, People and Money — straight from a VP's own portfolio mock.

Built once, designed to bp product standard on the Palantir Foundry data layer — reusable, not bespoke.

WHAT THE SINGLE PANE STANDS ON

The single pane is the top of a stack

The honest sequence: *curated & manual now* → *metrics mature* → *foundation solidifies* → *synthesis automates*. No over-promise auto-assembly on day one.

THE SHIFT

From today's pain to the single pane

TODAY

Data fragmented; numbers don't reconcile.

Performance assembled by hand each cycle.

Acting means leaving DASH for separate tools.

WITH DASH

One trusted pane on a governed foundation, with named owners.

Insight surfaced for the VP — amber/red themes ready for EPR.

In-product triggers turn insight into a tracked action in one click.

The map shows where to intervene; the single pane shows where it lands. Same journey, redesigned.

FROM TOOL TO WAY OF WORKING

A great pane nobody opens is a failed pane

Every prior bp dashboard that died was technically fine — it just never became a habit. Adoption is designed, not assumed.

WHO USES IT

VPs

“I need my portfolio’s position in one view before any forum.”

VP teams & leads

“I prep the numbers — once, not five times, and they reconcile.”

SVPs & LT

“I see a consistent picture across portfolios, not bespoke decks.”

HOW WE EMBED IT

1 • Roll out in waves

Focus group → refining area → wider portfolios. Prove value before scale.

2 • Train for the role

Targeted enablement per user group — VPs, teams, LT — not one generic deck.

3 • Hold the standard

An owned quality bar: intuitive, fast, trustworthy. Named owner keeps it high.

Embedded into existing forums and workflows — DASH becomes how performance is managed, not another place to look.

Resources, and the dependency we won't hide

WHAT IT COSTS — TO BE QUANTIFIED

People

Design, data engineering and a product owner — sustained, not a one-off build.

Software & platform

Foundry, the front-end stack, and ongoing data-pipeline run cost.

Enablement

Training and rollout effort across user groups as it scales.

Action: a BA to detail the full cost — people, software, run — before the funding decision.

“What if a team isn't using ADO?”

It's the sharpest question — and we answer it head-on.

The delivery metrics are computed from ADO. No ADO — or inconsistent ADO — means blanks, not wrong answers.

So we:

- Show coverage honestly — a team's data is only as complete as its ADO discipline, and we surface that.
- Make ADO hygiene a visible precondition — area paths, ordered backlogs, tagging — part of rollout, not an afterthought.
- Phase by readiness — start where ADO is clean (the refining area), use early value to pull other teams to the standard.

ONE STACK, ONE CONVERSATION

Two workstreams are heading for the same VPs

A single-pane service-design effort and an engineering metrics effort are both about to approach the same VPs. Coordinate, or duplicate.

Workstream A • Single-pane service design

Owens the synthesis and VP experience — stack layers 3–4.

Strength turning data into a story a VP acts on.

Needs trustworthy metric definitions and clean data to synthesise.

Workstream B • Engineering metrics & dashboard

Owens the metrics and the plumbing — stack layers 1–2.

Strength defining metrics correctly and making data trustworthy.

Needs the VP lens: which metrics matter and how leaders drill down.

The seam: both workstreams are about to ask the same VPs for requirements. Two uncoordinated approaches confuse the VPs and waste their time.

One joint VP approach

Go to the VPs together — one requirements conversation, not two.

Clear layer ownership

B owns data + metrics; A owns synthesis + the single pane. The metric set is the handoff.

One story to the SVPs

Present as a single stack, not two competing dashboards. Don't split the mandate.
